The prosthetic management of a case of epulis fissuratum by a novel technique

Rabia Mekayssi

Mohammed V University, Morocco

Background: The management of the epulis involves the elimination of causal factors, excision of fibrous tissue excess accompanied by an appropriate prosthetic rehabilitation. The confection of interim prosthesis or the rectification of old prosthesis for the setting up of a tissue conditioner is necessary to improve the healing and prevent the decrease of the vestibule depth after the surgical exeresis. Throughout this presentation we are going to present a new technique for the correction of old prostheses poorly adapted for the management of a case of the epulis fissuratum.

Keywords: Epulis fissuratum; Interim prosthesis; Conditioning tissue; Complete denture

Biography

Mekayssi rabia specialist dentist of prosthetic dentistry and affiliated with Mohammed V University in Morocco.
